

The Living Craft

Cohort website and backend

STATUS	OWNER	LAST UPDATED
Prepared for review	Team Alchemy	10 September 2026

Authors	Team Alchemy
Reviewers	Sunil Mathew and Ein
Related docs	Cohort handoff package
Scope	Functional implementation brief for Ein

Prepared by Team Alchemy for Ein and Sunil Mathew. 10 September 2026. Functional handoff LC-LAUNCH-2026-09-10. The campaign remains LC-STRATEGY-V3.0.0.

OUTCOME AND DELIVERY ORDER

Build a cohort landing page that saves applications reliably and gives the team a usable follow-up pipeline. Ein owns implementation and proposes the stack, integration providers, costs, hosting and deployment approach. Alchemy supplies content and acceptance review. Sunil owns programme facts and technical-fit decisions. This document specifies behaviour, not a prescribed technology stack.

Deliver a staging vertical slice first: page to form to saved application to staff lead record. Add receipts, permissions, attribution and pipeline changes next; then dashboard and manual email; then nurture and operational alerts. The wider website and tools use the same records later and do not delay the cohort route. A local handoff is not evidence of a working backend.

Keep the existing cohort URL working until the new route passes acceptance. Confirm the current host, URLs, mailbox and data owners before changing routing. No checkout, LMS, new chatbot or payment collection system is required in this release. Payment evidence comes from finance.

PAGE WIREFRAME

Desktop: a compact header above an outcome heading and two-column hero. Put the outcome, commitment and application button on the left; the video player on the right. Continue with a readable single-column narrative and occasional two-column comparisons. Put a compact application form after FAQs. A secondary enquiry action is available beside the primary action without competing visually.

Mobile: header, outcome, commitment, application action, video, fit, example, outcomes, curriculum, learning process, Sunil, commitment details, FAQs and application. Keep the action accessible before video playback. Reserve the video aspect ratio to avoid layout shifts. At 390px and at 200 percent zoom, controls and validation messages remain visible. Any sticky action must not cover form fields or the keyboard focus.

Order	Module	Required content and action
1	Outcome and VSL	Design agentic systems. Guide your team. 30 live hours plus independent work. Apply and Ask about the cohort.
2	Audience fit	Prior system-design exposure, readiness to build and revise, experienced engineers and leaders.
3	Practical example	Labelled illustrative returns workflow: policy evidence, recommendation, controlled action and review path.
4	Outcomes and curriculum	Working system, architecture reasoning, evaluation, design critique and guidance. Use validated learning areas; no invented module durations.

Order	Module	Required content and action
5	Learning process	Frame, build, examine behaviour, receive feedback and revise.
6	Sunil	Source-backed experience and teaching focus. No employer endorsement or unsupported result claim.
7	Commitment	30 live hours plus independent work; final schedule and terms confirmed before commitment.
8	FAQs	Fit, company projects, sponsorship, certificate, workload, schedule and terms.
9	Application	Labelled fields, privacy explanation, separate optional marketing permission, clear success/failure states.

Use the companion Cohort Page Copy and VSL Script as the content source. Build from that copy after review. The VSL is an additional 5–7 minute recording; its duration is a production estimate until recorded. Publish captions and a text transcript. Before footage is available, keep the written page complete and omit the player rather than presenting a broken video.

PUBLIC FORMS AND SUCCESS STATES

All forms require name and email; accept personal email addresses. Phone is optional. Use visible labels, appropriate input types, field-level errors, server validation, rate limiting and a bot check that does not obstruct keyboard users. Do not request confidential documents. Plain-text answers are escaped on display. Set field-length limits in the implementation contract and test them.

Form	Additional required fields	Optional fields	Record and next step
Open cohort application	Role, design experience, learning goal, funding route: self / employer / undecided	Organisation, phone, discovery answer	Application linked to person and cohort; Alchemy qualification
Cohort enquiry	Question	Role, organisation, phone, discovery answer	Enquiry; no application milestone inferred
Enterprise enquiry	Organisation, role, team learning goal	Approximate group size, industry, phone, discovery answer	Organisation opportunity and contact;

Form	Additional required fields	Optional fields	Record and next step
			Alchemy then Sunil scoping

The cohort ID is assigned from the server's active configuration, not accepted blindly from a hidden input. Final schedule need not be published to accept a fit enquiry. Disable new cohort applications when the programme owner closes applications; keep the enquiry route available with truthful wording.

On submit, validate, resolve the contact, create the enquiry/application and initial task, and queue acknowledgement/owner notification in one reliable transaction or equivalent durable workflow. Return success only after the record is committed. Repeated attempts using the same request key return the same reference. An email outage must not roll back a saved application. Database failure returns an error and preserves entered form values in the browser for retry without claiming success.

Application confirmation: "Your application has been received. We'll review your experience and learning goal and contact you about the next step. An application is not a confirmed place." Enquiry confirmation: "Your enquiry has been received. We'll contact you about your question." Show a submission reference. Never show another person's record from a guessed reference.

Collect optional marketing permission separately: "Email me programme updates and practical resources from The Living Craft. I can unsubscribe at any time." Leave it unchecked. Provide a privacy page identifying the actual data controller, purposes, processors, contact and retention policy before live collection. The owner must supply those facts; do not publish a generic invented policy. A receipt is not marketing consent.

STAFF SCREEN WIREFRAMES

Screen	Layout and actions
Overview	Date/cohort/route/source filters; acquisition and application totals; current pipeline; unassigned and overdue work; delivery failures. Each card opens the underlying filtered records.
Leads	Search by name/email/organisation; filter owner, stage, source and cohort; columns for contact, route, stage, last touch and next action; explicit empty and failed-load states.
Lead detail	Contact and preferences at top; application and attribution; chronological activity; tasks, meeting outcomes, offer and evidence tabs. Actions: assign, add note, set task, send email, pause nurture, update authorised stage.

Screen	Layout and actions
Pipeline	Separate member and enterprise views. Stage movement requires the appropriate role and a reason where closing or reversing. Milestone history stays visible.
Communications	Outbox, inbox/replies, templates and sequence history; preview recipient, subject, version and rendered body; send test, send manually, pause or cancel. Failed/unknown send outcomes have a review queue.
Administration	Staff roles, cohorts, sender verification, template versions, integration health, export/import, retention configuration and audit history. Secrets never appear in frontend code or exports.

Show skeleton/loading, empty, error and permission-denied states for every data screen. On narrow screens, turn lead rows into labelled records; keep essential owner and next-action controls accessible. Confirm destructive changes rather than making them one-click row actions.

DATA DICTIONARY

Use stable IDs. Store timestamps in UTC and display Asia/Kolkata by default. Every mutable business record includes `created_at`, `updated_at` and actor identity. Keep evidence dates separate from entry dates. Unknown values are null, with an explanation where reporting needs one.

Record	Minimum fields and meaning
Person	<code>person_id</code> ; name; <code>normalised_email</code> ; <code>original_email</code> ; optional phone; role; organisation link; contact preferences. Matching uses trimmed, case-normalised email; do not strip plus tags or merge different addresses by name.
Organisation	<code>organisation_id</code> ; organisation name; optional domain; industry; sponsor, L&D and budget contact links. Name-only matches are review candidates, not automatic merges.
Cohort	<code>cohort_id</code> ; public label; route; <code>application_open</code> ; approved schedule reference; offer version references. No date inferred from an internal ID.
Submission	<code>submission_id</code> ; <code>request_key</code> ; type application/enquiry; <code>person_id</code> ; <code>organisation_id</code> if

Record	Minimum fields and meaning
	relevant; cohort_id; experience; goal/question; funding route; optional group size; submitted_at; privacy notice version.
Opportunity	opportunity_id; person_id or organisation_id; route; cohort_id; stage; owner; stage_entered_at; closure reason; next_action and due_at. Applications and enquiries link to this record.
Attribution	submission_id; first captured source/medium/campaign/content/term; submission-session equivalents; sanitised entry path and referrer host; self-reported source; tracking permission and capture dates. Missing referrers remain direct/unknown, never guessed.
Consent	person_id; purpose; state; wording/version; obtained_at; source; withdrawn_at. Preserve changes; import provenance instead of treating old relationships as opt-in.
Activity and task	activity_id; opportunity_id; type; actor; occurrence time; notes; task owner/due/completed times. Record manual contact here before further nurture.
Meeting	meeting_id; opportunity_id; scheduled time; status scheduled/held/cancelled/no-show; held_at; outcome and next action.
Offer	offer_id; opportunity_id; approved_by; approved_at; version; currency; amount and term reference; accepted status. Only Sunil or an explicitly delegated approver can approve.
Finance evidence	payment_id; invoice/reference; person/order link; type receipt/refund; amount in currency minor units; currency; finance confirmer; received_at and evidence reference. Do not infer payment from an offer or receipt email.
Attendance	person_id; cohort_id; confirmation response/time; session_id; attended status; recorder and occurrence date. Enterprise participants link to their order.

Record	Minimum fields and meaning
Communication	message_id; person/opportunity link; purpose; template/version; sequence step; recipient; queued/sent/delivered/replied/bounced states and timestamps; provider ID; failure reason.
Audit history	record/type/ID; actor; previous and new value; event time; reason. Restricted access; no raw credentials.

An enquiry can later produce an application without losing either record. A repeated application from the same person/cohort updates the review context and keeps submission history; count one applicant for that cohort. Different cohorts get distinct applications. Prevent duplicate acknowledgements for retries of the same submission, while acknowledging a genuinely new request once.

Preserve supplied person/organisation IDs in imports and keep an import batch log. Validate, preview match/conflict counts, then commit. Reject conflicting IDs rather than silently replacing them. Provide scoped CSV export with the existing tracker fields so client reporting remains compatible; escape spreadsheet formula prefixes in exported free text.

PIPELINE AND PERMISSIONS

Member stages: enquiry, application received, qualification, technical review, offer, enrolled. Side states: on hold, unsuitable, withdrawn, closed. Enrolment requires Sunil's recorded acceptance/admission decision and finance-confirmed payment under the approved offer. Attendance remains independent. A refund creates evidence and a review task; it does not erase historical enrolment or attendance.

Enterprise stages: enquiry, qualification, technical scoping, quote, order agreed, delivery coordination, closed. Store participant nominations separately. An organisation order is not eight or ten individual cohort applications. Finance evidence and actual participant attendance remain separate.

Role	Allowed changes	Restricted changes
Alchemy operator	Contacts, qualification, notes, tasks, meetings, approved email templates	Cannot approve technical fit/offers or confirm finance evidence
Sunil	Technical fit, scope, offer approval, admission	Finance confirmation reserved for finance
Finance	Invoice, receipt, refund evidence	Cannot silently alter offer scope or attendance
Programme owner	Cohort availability, attendance confirmation and roster	Cannot infer payment from attendance

Role	Allowed changes	Restricted changes
Ein maintainer	Configuration and integration health; staging with synthetic data	Production personal-data access only when assigned for support

Authorisation is enforced server-side on reads, exports and writes. Admin pages and APIs require authentication; hiding a button is insufficient. Backups are access-controlled and restore-tested. The data owner confirms retention and deletion rules before production. Deletion and unsubscribe are different actions; retain only necessary suppression and audit evidence under the agreed policy.

INTERFACE CONTRACTS AND FAILURE BEHAVIOUR

Ein can choose endpoint names and vendors, but must demonstrate these logical contracts: submit application/enquiry; fetch scoped lead list/detail; add task/activity; change stage; queue approved email; receive delivery/reply/unsubscribe events; record finance/attendance evidence; export scoped records. Document request fields, validation, authentication, response/reference and retry behaviour for each in his technical proposal.

Server-side submission success emits a single authoritative saved event with `submission_id`. Client analytics uses an opaque event ID, never name/email/phone or free-text answers. Provider callbacks are authenticated, deduplicated and tolerate out-of-order delivery. A delivered callback must not override a later bounce, complaint or unsubscribe suppression. On a provider timeout with unknown send outcome, reconcile using the provider message/idempotency reference before retrying.

Use a durable outbox or equivalent so saved leads and email tasks cannot diverge silently. Failed background jobs enter a visible queue with bounded retries and staff alert. Dashboard queries show last refresh and errors; an unavailable integration must not display zero as if verified.

ANALYTICS EVENTS AND ATTRIBUTION

Event	Trigger	Deduplication and permissible dimensions
page_view / session_start	Consent-appropriate page/session observation	Analytics provider session rules; page path, coarse device, source dimensions
vsl_start / vsl_progress / vsl_complete	Actual supported player callbacks	Once per session/video/milestone; 25/50/75/complete; no guessed completion
cta_click	Named application/enquiry action	Event ID; CTA and page identifiers
form_start	First meaningful interaction	Once per session/form; no field values
form_error	Validation or submit failure	Error category and field name, never the rejected content

Event	Trigger	Deduplication and permissible dimensions
application_saved / enquiry_saved	Committed backend record	Once per submission; backend totals remain available without analytics consent
stage_changed / meeting_held	Authorised business event	Audit event ID; backend reporting only
payment_confirmed / attendance_recorded	Owner-entered evidence	Evidence ID; backend reporting only

Keep first captured attribution and submission-session attribution separately. Persist attribution across permitted sessions only; do not fingerprint or reconstruct rejected tracking. Strip sensitive query values and store only allowed UTM fields and sanitised paths. Self-reported discovery is another evidence field, not an override. Where marketing and application hosts differ, verify cross-domain handoff and prevent internal referrers from replacing the external source.

COMMUNICATION BEHAVIOUR

The companion Communication Copy contains receipts and day 2, 5 and 9 messages for applications, enquiries and enterprise enquiries. These are prepared templates requiring exact-version approval and verified sender/reply routing before activation. The reply-to mailbox must be monitored and replies linked into the lead history.

Day offsets are calendar days after a saved, eligible submission. Queue nurture at 10:00 Asia/Kolkata on the corresponding day. Transactional receipts are immediate. A receipt never enrolls someone in marketing. Only affirmative marketing consent enables nurture. A person has one active sequence for this programme; an enquiry-to-application change stops the enquiry sequence and creates a human review task rather than restarting marketing.

Check consent, template approval, cohort availability, stage and suppression both when queuing and immediately before dispatch. Stop on reply, meeting booked, offer, payment, withdrawal, unsuitable/closed state, unsubscribe, hard bounce or complaint. Pause for on-hold status or manual conversation. Stopped sequences do not restart automatically. Manual resume is available only for a paused, still-eligible sequence after operator review; never bypass a suppression or send missed messages in a burst.

If reply detection or unsubscribe processing is unavailable, disable nurture and retain manual requested-service replies. Manual marketing messages obey the same suppression rules. Unsubscribe is one action through a signed opaque link without login; it changes marketing preference and cancels queued messages without exposing contact information. Show generic confirmation for invalid/expired links with a contact route.

Send internal new-lead and assignment alerts immediately, without private free-text content in notifications. Send one due-task alert per task and a daily 10:00 overdue summary to each owner. Route failed notifications to the integration-failure queue. Staff can change these operational times; do not promise public response times until capacity is confirmed.

ACCEPTANCE AND RELEASE EVIDENCE

Ein records each case as not run, passed or failed with environment, date and evidence. This handoff does not mark implementation tests passed.

ID	Scenario	Expected result
E01	Valid application with and without marketing permission	Saved once, reference shown, receipt queued; nurture only with permission
E02	Duplicate click, refresh and network retry	Same submission reference; one record and one acknowledgement
E03	Database unavailable	No false success; form values retained for retry; staff can observe failure
E04	Email outage after save	Lead remains visible; failed outbox item; retry does not create duplicate application
E05	Existing contact, new enquiry and later application	One person, preserved submission history, correct applicant count
E06	Employer sponsorship and enterprise group	Correct separate routes; sponsor not counted as participant
E07	Consent declined and anonymous visit	No marketing sequence; no invented person or hidden tracking linkage
E08	UTM, direct return, external referrer and cross-host form	First/submission sources retained as defined; unknown stays unknown
E09	Reply, meeting booking or unsubscribe before queued send	Pending nurture cancelled; no later automatic restart
E10	Provider timeout, duplicate/out-of-order callbacks	No duplicate send; suppression cannot be reversed by stale callbacks
E11	Role access and guessed record/export URL	Unauthorised data and mutations denied server-side
E12	Stage correction, refund and attendance change	Author and reason retained; finance and attendance independently reported
E13	Import conflict and CSV formula-like text	Conflict preview; existing IDs preserved; safe export

ID	Scenario	Expected result
E14	Synthetic dashboard dataset	Totals reconcile to underlying records, dates and currency; no unknown-as-zero
E15	390px, keyboard, zoom and screen-reader form labels	No covered controls, missing labels or inaccessible error/success feedback
E16	Backup restore and integration disconnect	Restored data verified; stale/error state visible instead of fabricated zero
E17	Public indexing and private administration	Public copy crawlable; admin/API authenticated; no private data in search or analytics
E18	Closure of applications	Application disabled truthfully; enquiries available; queued promotional invitations stopped

Before release, confirm sender domain authentication, monitored reply handling, unsubscribe, approved privacy facts, staff accounts, working route, final public copy and rollback procedure. Use synthetic records and a controlled test mailbox. Record cleanup of test records before opening production. Ein presents staging evidence; Sunil/client authorises publication.

Design agentic systems. Guide your team.

Build a working agentic system with Sunil Mathew. Develop the ability to explain its design, examine its behaviour and guide the decisions behind it.

30 live hours plus independent work.

Apply for the open cohort

Ask about the cohort

FOR PEOPLE WHO ALREADY WORK WITH SYSTEM DESIGN

You may be an experienced engineer, architect or engineering leader. You understand that a system's design involves trade-offs, and you want to deepen how you approach those choices in agentic systems.

Bring prior system-design exposure, a learning goal and the willingness to build, explain your decisions and revise your work through feedback.

FOLLOW A DECISION BEYOND THE DEMO

Imagine a returns assistant that reads a policy and recommends a refund. Now give it a tool that can issue the refund. The system can move money, and its design needs to account for that responsibility.

What evidence permits the action? How does it recognise a repeated request? What happens when the policy is unclear or a tool result is uncertain?

This illustrative example shows the kind of connection you will practise: from a design choice to behaviour you can examine.

DEVELOP PRACTICAL DESIGN JUDGMENT

Build a working agentic system and connect its behaviour to the architecture behind it. Practise explaining why a boundary exists, what evidence supports a decision and what you would change next.

Develop how you design and critique agentic systems, review a team's proposal and provide useful guidance.

WHAT THE WORK EXPLORES

Purpose and constraints: frame the task, the context and the choices the system needs to support.

Tools and authority: examine what the system may do, the evidence it needs and where a person should decide.

Evaluation: inspect behaviour and failures, and connect findings to a useful design change.

Reliability and cost: consider uncertain results, retries, review effort and the trade-offs around the model.

Design review: explain the architecture, listen to challenges and identify the next useful piece of work.

BUILD, EXAMINE AND REVISE

The working system gives the discussions something concrete to return to. Build an approach, examine what happens and use continuous feedback to understand strengths, gaps and follow-up work.

Industry-specific practice is the default. Company-specific work needs a separate conversation about scope and permission.

WORK WITH SUNIL MATHEW

Sunil brings engineering and leadership experience from Google, Amazon, Walmart and startups. His focus is the reasoning behind a system's design and the evidence that helps a team make its next decision.

MAKE ROOM FOR THE WORK

The programme includes 30 live hours with Sunil, plus independent work. Confirm the session schedule, independent-work commitment, attendance support and access arrangements before joining.

The open cohort targets eight members. Discuss current availability during the fit conversation. Applying starts a discussion; admission, payment and attendance confirmation are separate steps.

QUESTIONS BEFORE JOINING

Do I need a company project?

No. Industry-specific cases are the default. Do not share confidential company materials in an application.

Can my employer fund my place?

Yes. Apply as an individual and ask for the employer-funding summary. An enterprise group programme is a separate purchase and scoping conversation.

Is there a certificate?

No. The focus is the capability you develop through practical work and continuous feedback.

How much independent work is involved?

Independent work is additional to the 30 live hours. Its amount and interval will be confirmed before joining.

What are the dates and fees?

Confirm the schedule, fees, payment, refund and access terms in the final offer before committing.

Can we arrange learning for a team?

An enterprise programme normally brings 8–10 participants together with a schedule agreed for the group. Begin with your learning objective, participant experience and industry context.

START WITH YOUR EXPERIENCE AND A QUESTION

Tell us about your system-design experience, your current responsibilities and what you want to develop. Let us know whether you are self-funded or exploring employer support.

Apply for the open cohort

Programme enquiries and employer-funding support: apply@thelivingcraft.ai

Enterprise enquiries: apply@thelivingcraft.ai

A working system and the decisions behind it

Imagine you are watching an agent handle a customer's return. It finds a policy, explains the options and recommends a refund. The conversation looks good. You can follow the answer, and it is easy to see how the idea could be useful.

Then someone asks a perfectly reasonable question. Can it issue the refund as well?

On a diagram, that might look like one more connection. In the real world, the system can now move money. And that changes the conversation.

What gives it permission? Which evidence is enough? What happens when the same customer sends the same request twice? What if the tool times out and we cannot tell whether the refund happened?

This is an illustrative example. But it captures the kind of question I want us to spend time on: how do we connect what an agent can do with a design we can understand, examine and explain?

I'm Sunil Mathew. My engineering and leadership experience includes Google, Amazon, Walmart and startups. At The Living Craft, I bring that perspective into a practical programme on designing and critiquing agentic systems, and guiding a team's architecture decisions.

If you already work with system design, you know that the interesting part is often the trade-off. A design can look clean until you put it next to a real constraint. A useful review helps you understand which decision matters and what evidence would change your mind.

Let's go back to the returns example for a moment. I would first separate the recommendation from the action. The assistant might gather policy evidence and prepare an answer. The refund tool needs its own controls over what it will actually allow.

Then I would look at uncertainty. Suppose the request falls outside the policy we have. We need a clear next step. Suppose the tool responds slowly or gives us an ambiguous result. We need a way to examine the state of the action before deciding whether to repeat it.

And I would want to see more than a successful final answer. Which evidence did the system use? What did the tool do? Did the workflow stay within its intended boundaries? If something went wrong, can the team explain where and why?

Once we can see those things, evaluation becomes useful to the design. It can tell us where a permission is too broad, where evidence is missing or where a person needs to make a decision. We can make a change and examine the behaviour again.

That connection between building, reasoning and evidence is central to The Living Craft. You work on a functioning agentic system, and you practise explaining the choices behind it. The working system gives us something concrete to discuss and revise.

We explore purpose and constraints, tools and authority, evaluation, reliability, cost and accountability. The aim is to strengthen your ability to design and critique the system, and to help a team reason through its own design decisions.

Guiding a team does not mean replacing every idea with your preferred architecture. It means understanding the decision in front of the team, asking useful questions and helping identify the next piece of work. Perhaps that is a test. Perhaps it is a narrower permission. Perhaps it is a clearer explanation of the trade-off.

Continuous feedback supports that practice. We look at strengths, gaps and what to work on next. There is no certificate. The focus is the capability you develop through the work and the discussions around it.

The programme includes 30 live hours with me, plus independent work. Before joining, we will need to confirm the session schedule, the independent-work commitment and the complete programme terms with you. Make room for the practical work as well as the live conversations.

You do not need to bring confidential company architecture to apply. Industry-specific practice is the default. A company-specific case needs its own scope and permission. If your organisation wants a team programme, that is a separate enterprise conversation.

For the open cohort, the useful starting point is your experience. What systems have you worked with? Which decisions are you responsible for? What would you like to get better at designing, reviewing or explaining? You may be self-funded or need employer support; the application can help us understand that route too.

If this is the kind of practice you are looking for, explore the open cohort. Tell us about your starting point and one question you want to work on. We can discuss fit, current availability and the full commitment before you decide.

Cohort communication copy

The Living Craft

APPLICATION-RECEIPT

Subject: We have received your Living Craft application

Thank you for applying to The Living Craft.

We have received your experience and learning goal. The next step is a conversation about programme fit and the commitment involved.

Applying does not confirm admission or a place. Schedule, workload and final terms should be clear before you decide.

If you have a question or need to correct your application, reply to this email.

The Living Craft

ENQUIRY-RECEIPT

Subject: We have received your cohort enquiry

Thank you for getting in touch about The Living Craft.

Your enquiry has been received. We will review your question and contact you about the next step.

If there is anything you would like to add, reply to this email. Please avoid sending confidential company materials.

The Living Craft

ENTERPRISE-RECEIPT

Subject: Your Living Craft team enquiry

Thank you for contacting The Living Craft about your team.

We have received your enquiry. We will begin with your learning objective, participant experience and industry context, then coordinate a scoping discussion with Sunil.

Please reply if you would like to add context. Company-specific work requires agreed scope and permission; no confidential documents are needed to begin.

The Living Craft

APPLICATION-DAY2

Subject: The design question behind a working agent

Imagine a returns assistant that recommends a refund. Giving it the ability to issue that refund adds questions about evidence, permissions and repeated requests.

At The Living Craft, the working system gives these design choices something concrete to connect to. Members build, examine behaviour and revise through feedback.

As you consider the programme, which decision would you like to become better at explaining? You can reply with a non-confidential example.

The Living Craft

You asked to receive programme updates and practical resources.

ENQUIRY-DAY2

Subject: What you would practise at The Living Craft

The Living Craft connects practical building with architecture reasoning. Members work on an agentic system and examine tools, authority, evaluation, reliability and cost.

An illustrative returns assistant is a useful starting point: recommending a refund and issuing it involve different responsibilities. The programme explores how to make those choices visible and testable.

If that matches what you want to develop, explore the programme page or reply with your question.

<https://learning.thelivingcraft.ai/>
