

# Choose for the job

A planner, checker and writer can have different needs. Start by naming the decision each one owns.

# Define acceptable behaviour

What must this role get right?  
Which failure would make the  
output unusable?

# Compare on your cases

Use representative inputs and the same acceptance criteria. Include difficult and incomplete cases.

# Count the surrounding cost

Include retries, review time and failed work alongside model charges. A cheaper call can cost more overall.

# Test the checker too

A second model can share mistakes. Compare its judgments with known cases and qualified human review.

# Make the choice revisitable

Record the reason, the limitation and the evidence that would trigger a new comparison.

Illustrative model-selection review.
